

Análise preliminar da classificação de métodos da revolução da credibilidade

2026-06-16

Sumário

1	Escopo e cautela	1
2	Regra de contagem	1
3	Validação do pipeline	1
4	Cobertura da classificação	2
5	Perfil dos artigos classificados	3
6	Métodos da revolução da credibilidade	4
6.1	Casos no numerador conservador	5
6.2	Fila <code>other_modern_causal_method</code>	9
7	Fila de atenção	10
8	Próximos usos	14

1 Escopo e cautela

Este relatório antecipa a estrutura da análise final usando os artigos já classificados por leitura integral. A base atual contém 400 artigos classificados de um manifest de 6464, ou 6.2% do corpus elegível preparado para classificação.

Os resultados são **preliminares**. Os artigos classificados correspondem aos primeiros registros do manifest, não a uma amostra aleatória do corpus completo. Portanto, as taxas abaixo servem para testar o pipeline analítico, identificar casos para auditoria e preparar o relatório final; elas não devem ser tratadas como estimativas substantivas finais do paper.

2 Regra de contagem

A análise usa a convenção documentada em `docs/credibility_method_counting_rule.md`:

- a **medida principal/conservadora** conta apenas métodos estritos de identificação causal;
- `other_modern_causal_method` é tratado como **fila de auditoria manual**;
- a medida **inclusiva de sensibilidade** é a união de artigos únicos com método estrito ou `other_modern_causal_method`, mas permanece preliminar enquanto não houver adjudicação manual.

Na base atual, a medida conservadora identifica 15 artigos; a fila `other_modern_causal_method` tem 2 artigos, dos quais 0 não têm método estrito também; e a medida inclusiva teria 15 artigos únicos.

Tabela 1: Medidas preliminares para métodos da revolução da credibilidade

measure	n	denominator	percent	interpretation
Principal/conservadora	15	400	3.8	Conta apenas métodos estritos de identificação causal.
Fila	2	400	0.5	Não entra automaticamente no numerador principal;
other_modern_causal_method				pode sobrepor casos estritos.
other_modern sem método estrito	0	400	0.0	Subconjunto residual ainda não capturado por método estrito.
Inclusiva (união de artigos únicos)	15	400	3.8	União de artigos únicos com método estrito ou other_modern_causal_method.

3 Validação do pipeline

Todas as validações duras passaram antes da geração deste relatório: unicidade de PIDs, correspondência com o manifest, compatibilidade estrita do `input_text_hash`, presença de reading logs, existência e vazios do diretório `failed/`, anos no intervalo esperado, exclusão dos periódicos fora do escopo e status `PASS` de `fulltext`.

Tabela 2: Validações de integridade da base preliminar

check	status	value	expected
classification_rows	PASS	400	> 0

pid	title	journal	year	method	industry	design_quote	tough_call_reason
S198138212012000100070	Trust and Information: Attitudinal Change in Participants in the Youth Parliament in Brazil	Brazil	2012	difference-in-differences	Political	“To answer this question, we used the method of ‘difference in difference.’ The variables used were derived by subtracting the values at time 1 (before the YP) from values at time 2 (after the YP took place) for each of the two groups (treatment and control).”	The article explicitly invokes quasi-experimental logic and difference in difference, but the body text also states that the data do not allow a direct causal test of whether political information caused increased confidence. This creates ambiguity for the mechanism claim, though not for the presence of a difference-in-difference-style causal design for program effects.
S198138212013000100003	Investigating behavior through field experiment in Brazil: do candidates answer more to core or swing voters?	Brazil	2013	experimental	Political	This article is based on a field experiment conducted in the context of the 2008 Brazilian municipal election.	NA

pid	title	journal	year	method	design	quote	tough_call_reason
S1981 38212015000100135	The Conditional Cash Transfers in Four Presidential Elections (2002–2014)	Brazil	2015	matching	li-ti-cal Sci-ence Re-view	This was weighting matching beneficiaries to non-beneficiaries on gender, age, income, education, region, race (when available), and municipality’s human development index (HDI-M) of respondents[3]. Matching was done using the genetic matching algorithm, developed by Diamond and Sekhon (2005).	The paper uses matching and generalized propensity score methods and explicitly frames estimates as BFP effects, supporting a credibility-revolution matching classification. However, it also acknowledges that Brazil lacks randomized pilots or sharp discontinuities and that the 2014 indirect-effect explanation is not directly tested, so causal attribution is qualified.
S1981 38212015000300003	Impact of Voting Machines on Blank Votes and Null Votes in Brazilian Elections in 1998	Brazil	2015	difference-in-differences	li-ti-cal Sci-ence Re-view	A simple difference-in-differences “isolate” the effects of cities’ socioeconomic levels is to compare the average amount of null and blank votes from 1998 to those from the same cities in the previous elections (1994), a technique known as difference-in-differences, or diff-in-diff.	The article explicitly uses difference-in-differences as a causal design, but presents the results as average percentage-point differences without regression output or uncertainty estimates. I therefore classify it as statistical modeling for the quantitative-analysis type because of the explicit DiD design, while coding statistical inference as absent.
S1981 382120170002000203	Future impacts of having a female mayor	Brazil	2017	regression discontinuity	li-ti-cal Sci-ence Re-view	Qionerdisocial strategy is to apply a sharp regression discontinuity approach in the same way as Lee, Moretti, and Butler (2004) and Lee (2008).	NA
S1981 382120180002000205	Affirmative Attitudes of Whites: Evidence from a List Experiment Survey in Brazil	Brazil	2018	experiment	li-ti-cal Sci-ence Re-view	The list experiment embedded in the survey randomly assigned respondents to a baseline group, the control group or the treatment group.	NA
S1981 382120180002000205	Affirmative Attitudes of Whites: Evidence from a List Experiment Survey in Brazil	Brazil	2018	experiment	li-ti-cal Sci-ence Re-view	The list experiment embedded in the survey randomly assigned respondents to a baseline group, the control group or the treatment group.	NA

pid	title	journal_year	method	design_type	design_quote	tough_call_reason
S1983821	Migrant 20190002002 ces and Rights to Physical Integrity: A Cross- section Study of Latin America (1981-2014)	Brazil2019	instru-	Ther	There are variables approach based on instrumental variables is in order.	NA
S1983821	Brazilian 2020000100200 nal Develop- ment Coopera- tion and Public Opinion: Domestic Costs Faced by a Troubled Emerging Donor	Brazil2020	exper	the participants were	randomly assigned to a control group or one of two treatment groups	The article is clearly quantitative and experimental, but the mixed empirical and qualitative classification requires judgment because the qualitative material is mainly contextual and motivational rather than a standalone qualitative analysis. It is still substantive because the article uses legislative episodes, campaign rhetoric, foreign-policy history, and MINUSTAH context to build and interpret the empirical argument.
S1983821	How 'De- 2020000100201 the Democratic Peace? A Survey Experiment of Foreign Policy Preferences in Brazil and China	Brazil2020	exper	One study involved survey	experiments in China and Brazil.	NA
S1983821	Sources of 2022000100202 bency (Dis)Advantagi-	Brazil2022	regress	RDD design based on	elections are particularly common since the discontinuous assignment of victory in close races often provides a credible research design to make causal inferences about the effect of incumbency on the likelihood of reelection.	NA

pid	title	journal_year	method	design_quote	tough_call_reason
S1983821	Better Marks: A Synthetic Control Evaluation of the Educational Policies in Ceará, Brazil	Brazil2023	Synthetic control	“SGM is employed in this investigation to overcome this limitation.”	NA
S1983821	Mandatory Amendments: a Change in the Pattern of Executive Dominance in the Brazilian Budgetary and Financial Cycle	Brazil2023	Difference-in-difference	“This arrangement is appropriate for the difference-in-difference method, which consists in comparing changes in the pattern of the dependent variable between the treatment groups – coalition and reelected deputies after EC 86/2015 – and the control group.”	The quantitative and causal classifications are clear, but the mixed-empirical classification requires judgment because much of the qualitative material is institutional/legal reconstruction rather than interview- or ethnography-style qualitative analysis. It is still substantive qualitative evidence because the article uses legislative speeches, constitutional texts, procedural rules, and documentary evidence to reconstruct the institutional change and its mechanisms.
S1983821	From the Diffuse: the Indirect Effect of Crime Victimization on Support for Democracy,	Brazil2023	aggregationalist	“This strategy consists of three main steps. First, I run several matching estimations to achieve covariate balance between treatment and control groups... Second, I employ a novel mediation analysis approach, the regression-with-residuals (RWR)... Third, I run sensitivity analyses	NA
S1983821	From the Diffuse: the Indirect Effect of Crime Victimization on Support for Democracy,	Brazil2023	matching	“This strategy consists of three main steps. First, I run several matching estimations to achieve covariate balance between treatment and control groups... Second, I employ a novel mediation analysis approach, the regression-with-residuals (RWR)... Third, I run sensitivity analyses	NA

pid	title	journal_title	year	method	style	design_quote	tough_call_reason
S2236-5710	DESIGUALDADE E GÊNERO: O Efeito do Tratamento dos Observatórios Sociais Municipais Brasileiros sobre os Custos da Educação Superior em 2010 e 2019	CADERNOS DE PESQUISA DA FIOCRUZ	2024	matching	or_weighting	O artigo usa CEM e linguagem de identificação de efeitos, o que sustenta registrar matching_or_weighting como método de credibilidade; porém a justificativa causal é limitada, com pareamento e regressões apresentados sobretudo como redução de viés observável, sem discussão detalhada de ignorabilidade ou desenho quase-experimental.	
S2236-5710	Efeito do Tratamento dos Observatórios Sociais Municipais Brasileiros sobre os Custos da Educação Superior em 2010 e 2019	CADERNOS DE PESQUISA DA FIOCRUZ	2025	difference-in-differences	Two Way Fixed Effects	The paper contains institutional descriptions and quoted material about observatory practices, but these serve as context and mechanism discussion rather than a substantive qualitative empirical analysis. I therefore classify the empirical evidence as quantitative_only rather than mixed_empirical.	
S2236-5710	Efeito do Tratamento dos Observatórios Sociais Municipais Brasileiros sobre os Custos da Educação Superior em 2010 e 2019	CADERNOS DE PESQUISA DA FIOCRUZ	2025	difference-in-differences	Two Way Fixed Effects	The paper contains institutional descriptions and quoted material about observatory practices, but these serve as context and mechanism discussion rather than a substantive qualitative empirical analysis. I therefore classify the empirical evidence as quantitative_only rather than mixed_empirical.	

6.2 Fila other_modern_causal_method

Tabela 10: Fila de auditoria manual para other_modern_causal_method

pid	title	journal_title	year	other_modern_causal_method	tough_call_reason
S1981-3821	Better Incentives, 2003: A Synthetic Control Evaluation of the Educational Policies in Ceará, Brazil	Brazilian Political Science Review	2023	TRUE FALSE SCM is employed in this investigation to overcome this limitation.	NA

pid	title	journal	year	other_node	modern_covariate	overlap_with_qonly	tough_call_reason
S1981-38212023000200004	From the Specific to the Indirect Effect of Crime Victimization on Support for Democracy,	Brazilian Political Science Review	2023	TRUE	FALSE	This strategy consists of three main steps. First, I run several matching estimations to achieve covariate balance between treatment and control groups. . . Second, I employ a novel mediation analysis approach, the regression-with-residuals (RWR). . . Third, I run sensitivity analyses	NA

7 Fila de atenção

Os **tough calls** são úteis para a próxima rodada de auditoria manual, porque indicam decisões em que o classificador registrou ambiguidade substantiva ou operacional.

Tabela 11: Primeiros 25 tough calls para auditoria

pid	title	journal_year	other_node	modern_covariate	overlap_with_qonly	tough_call_reason	
S1981-38212007000100053	Tradition and in the Uses and Definitions of the Law: A Proposed Analysis	Brazilian Political Science Review	2007	none	none	not_empirical	The body text references Table 1 and Table 2 and mentions an analysis of authors involved in curriculum reform, which creates some ambiguity. Because the provided text does not include table contents or report a systematic original empirical procedure, these references are treated as illustrative support within a conceptual framework rather than as original empirical analysis.
S1981-38212007000100102	Career Choice Legislative Reelection: Evidence from Brazil and Colombia	Brazilian Political Science Review	2007	mixed	statistical	theoretical	The modeling has strong explanatory language and statistical modeling, but it relies on observational random-effects probit regressions and interaction comparisons without a design-based identification strategy, so it should not be counted as a credibility-revolution method.
S1981-38212007000200074	Women and Quality in the Elections for the Senate: Brazil and the United States in Comparative Perspective	Brazilian Political Science Review	2007	quantitative	statistical	theoretical	The modeling uses explanatory language and statistical models, but it does not present a design-based causal identification strategy. The appropriate credibility-revolution coding is therefore observational regression with causal or explanatory claims but no credibility-revolution method.
S1981-38212007000200108	Rethinking The Withering of State Dominant Machines in Brazil	Brazilian Political Science Review	2007	mixed	statistical	theoretical	The papering combines typological qualitative comparison with quantitative factor analysis and correlations. Its causal explanation is substantive, but the article itself notes that the Bolsa Familia evidence rests on simple correlations, so it should be screened but not counted as a credibility-revolution design.

pid	title	journal	year	type	principal	quantitative	did not	did not	did not	reason	reason
S198138212008000100010	Personal Urban Poverty: Preliminary Findings	Brazilian Political Science Review	2008	Mixed statistical	empirical	no	no	no	no	The quantitative classification is clear because the article uses K-means clustering analytically, but the causal screening is a judgment call because the article uses explanatory language about determinants and impact while presenting preliminary observational and typological analysis without an identification design.	
S198138212008000100057	Brazilian and the Power of "Old" Theories of Party Competition	Brazilian Political Science Review	2008	Mixed empirical	no	no	no	no	no	The article takes itself as an essay using established theories rather than as a conventional methods-driven empirical article. The quantitative classification rests on the author's tables, graphs, percentages, indexes, and especially reported correlations; the qualitative classification rests on case-based historical and policy interpretation rather than interviews, archives, or formal qualitative methods.	
S198138212008000100096	Re-evaluating Contribution and Legacy of Hedley Bull	Brazilian Political Science Review	2008	one none	not empirical	no	no	no	no	The article performs sustained textual interpretation of theoretical works, which could superficially resemble qualitative text analysis. However, the stated purpose and execution are conceptual exegesis and critical theory discussion, and the prompt excludes conceptual essays and literature reviews without original empirical analysis from empirical classification.	
S198138212008000200010	The Role of Congress in Foreign Policy: An Empirical Contribution to the Debate	Brazilian Political Science Review	2008	Mixed descriptive	no	no	no	no	no	The article takes only explanatory institutional claims and uses descriptive quantitative indicators, but it does not use statistical tests, modeling, or a design-based causal identification strategy. I therefore classify the quantitative component as descriptive only and do not treat it as a credibility-revolution screen case.	
S198138212008000200039	Development, Governance, and Local Democracy	Brazilian Political Science Review	2008	one none	not empirical	no	no	no	no	The paper closely interprets policy documents and development discourse, which could resemble qualitative document analysis, but it does not present an explicit empirical design, corpus, method, or original systematic qualitative analysis. I therefore classify it as a conceptual/theoretical critical essay rather than an empirical qualitative paper.	
S198138212008000200074	Policy the Chilean Senate: An Analysis of Coauthorship and Roll Call Data	Brazilian Political Science Review	2008	quantitative statistical	no	no	no	no	no	The modeling uses explanatory language and uses statistical modeling, but the models are spatial-scaling and network-position analyses rather than causal identification designs; therefore it passes the screen but has no credibility-revolution method.	

pid	title	journal	year	type	principal	quantitative	descriptive	qualitative	reason
S198138212008000200093	Justice, Pro- and Politics in the Exercise of Judicial Review by Brazil's Supreme Court	Brazilian Political Science Review	2008	mixed	statistics	descriptive	qualitative	theoretical	The article uses logistic regression and explanatory language about factors influencing decisions, but it does not articulate a design-based causal identification strategy. I therefore screen it for credibility-revolution methods but classify the method as observational regression with causal or explanatory claims and no credibility-revolution design.
S198138212008000200093	How Safe are A Comparison of Voluntary and Compulsory Voting Systems	Brazilian Political Science Review	2008	none	none	not	empirical	theoretical	The article uses probability analysis, equations, standard deviations, and hypothetical numerical examples, which are quantitative in a formal mathematical sense. However, the classifier requires original or reanalyzed empirical quantitative data analysis, and the article does not analyze observed data.
S198138212009000200011	Politics and Lessons from Latin America	Brazilian Political Science Review	2009	qualitative	only	qualitative	theoretical	only	The article includes several descriptive numbers and cited survey percentages, especially from the Parliamentary Elites in Latin America survey, but these are used as secondary contextual evidence rather than as the authors' original or reanalyzed quantitative analysis.
S198138212009000200030	Strong Robust Democracies? Separation of Powers and Rule of Law in Latin America	Brazilian Political Science Review	2009	mixed	descriptive	statistics	qualitative	theoretical	The article describes itself as conceptual and exploratory and relies heavily on literature synthesis, but it also presents and interprets comparative descriptive indicators and country cases as empirical evidence. I therefore classify it as mixed empirical with descriptive quantitative analysis only, not as purely theoretical or as inferential quantitative research.
S198138212009000200060	At What Legislature Become Institutionalized? the Mercosur Parliament's Path	Brazilian Political Science Review	2009	mixed	descriptive	statistics	qualitative	theoretical	The article is primarily qualitative, but it also presents original descriptive counts and averages of Parlasur activity, especially normative acts and attendance patterns. These descriptive quantitative summaries justify coding it as mixed empirical and Torreblanca-style quantitative, but only as descriptive_statistics_only.
S198138212009000200127	Political Foreign Policy and Ideology: Argentina and Chile in Comparative Perspective	Brazilian Political Science Review	2009	mixed	statistics	descriptive	qualitative	theoretical	The article uses statistical modeling through NOMINATE and makes explanatory claims about party ideology, so it must be screened, but it does not use a design-based causal identification strategy or report inferential uncertainty in the body text provided. It also has a qualitative component based on plenary stenographical notes, but the provided body summarizes that component rather than reproducing detailed qualitative evidence.

pid	title	journal	year	principal_title	principal_title_id	principal_title_posts	principal_title_posts_id	reason
S1981382120110000100010	Electoral Political Institutionalization in the Federal Deputy Elections in Brazil (1998, 2002 and 2006)	Brazilian Political Science Review	2010	quantitative statistical	10000100010	The article reports on affecting or increasing chances of electoral success, and it estimates logistic regressions, but it does not articulate a design-based identification strategy; therefore this is screened but coded as observational regression with causal/explanatory claims and no credibility-revolution design.		
S198138212011000100033	Judicialization Policy in the Definition of Access to Public Goods: Individual Rights versus Collective Rights	Brazilian Political Science Review	2010	mixed descriptive	1000100033	This article's quantitative analysis is purely descriptive, but it uses those descriptive findings to support explanatory claims about judicial interference and distributional effects. I therefore screened it for credibility-revolution methods while classifying no such method as present.		
S198138212011000200030	Federalism, and Institutional Change: General Trends and One Case-study	Brazilian Political Science Review	2010	mixed descriptive	1000200030	This article combines descriptive quantitative analysis with a qualitative case-study explanation. Its causal language could be mistaken for causal inference, but the empirical strategy is descriptive comparison and roll-call analysis without statistical inference or a design-based causal identification strategy.		
S198138212011000200078	The Political Rewards of Education in Brazil	Brazilian Political Science Review	2010	quantitative statistical	1000200078	The article foregrounds descriptive time-series graphs in this article, but it also explicitly reports correlations, logistic regressions, inferential tests, and multivariate statistical tests. It therefore goes beyond descriptive statistics, while still lacking a design-based causal identification strategy.		
S198138212011000300011	How Was the Poupatempo Experience in Brazil? Institutional Bypass as a New Form of Institutional Change	Brazilian Political Science Review	2011	qualitative only	1000300011	The article reports many administrative figures, budgets, costs, survey percentages, and satisfaction numbers, but these are used as contextual or cited descriptive evidence rather than as original or reanalyzed quantitative analysis by the authors.

S198138212011000100054	Brazilian According to their Manifestos: Political Identity and Programmatic Emphases	Brazilian Political Science Review	2011	mixed bivariate	quantitative	The article discusses whether to code the quantitative analysis as descriptive only or bivariate/inferential. Because the article reports an association test, residual analysis under a null hypothesis of independence, and a statistically significant Cohen's kappa reliability test, it goes beyond descriptive statistics, but it does not use multivariable statistical modeling.	
S198138212011000100077	Euroscepticism National Elections: The Rise of Voter Support for New Radical Right Parties	Brazilian Political Science Review	2011	quantitative	statistical	The article uses fixed-effects panel models and explanatory language about the impact of representation on ERP support, but it does not present treatment timing, treated/control comparisons, parallel-trends logic, or another explicit design-based identification strategy. Therefore it is screened but not classified as having a credibility-revolution method.	
S198138212011000200010	Judiciary- relations in Policy Making: the Case of Drug Distribution in the State of São Paulo	Brazilian Political Science Review	2011	qualitative only	qualitative	The article includes several numerical facts from administrative sources and prior studies, but these are contextual or secondary figures rather than the authors' own systematic quantitative analysis.	
S198138212011000200039	Independence Delegation? Presidential Calculus and Political Interference in Brazilian Regulatory Agencies	Brazilian Political Science Review	2011	mixed statistical	quantitative	The article makes explanatory claims and uses random-effects panel regression, but it also describes the analysis as exploratory and does not articulate a design-based causal identification strategy; therefore it should be screened but not coded as using a credibility-revolution method.

Quando a classificação do corpus completo terminar, o mesmo pipeline deve ser rerodado após a consolidação final com `--combine-only`. A estrutura de tabelas e figuras já estará pronta; a etapa substantiva final será substituir a base preliminar parcial pela base completa classificada e revisar manualmente a fila `other_modern_causal_method`.
